Whereas the greatest care has been taken in the compilation of the contents of this publication, the Department of Minerals Resources does not hold itself responsible for any errors or omissions.

FOREWORD

Due to several recent changes in the South African salt industry, particularly with regard to ownership, it was deemed necessary to update this directory of salt producers in South Africa. Data contained in this edition were supplied by the various companies listed, to whom due acknowledgement is made. Where available email and website addresses are included.

Further details relating to South Africa's industrial minerals are given in the Directorate's annual review of the South African Mineral Industry (SAMI).

We hope that this directory will once again prove itself valuable to the producers, processors, marketers and consumers of South Africa's salt.

December 2013

INTRODUCTION

Salt has the chemical composition of Sodium Chloride and a readily available inexpensive bulk mineral that can be produced by a variety of methods:

- Solar brine – seawater evaporation in shallow coastal basins or artificial ponds. Lake brine is also used as feed in conventional solar ponds.
- Underground deposits of halite or rock salt, mined by room and pillar, or solution mining which forms a large underground cavity.
- Vacuum evaporation – brine dehydration to crystallise salt in a series of multiple-effect evaporators operated under vacuum to reduce process temperatures.

Salt is critical to human and animal health. It is a common part of our everyday lives that is rarely thought of, as it is a natural resource that must be discovered, boiled/evaporated or mined, processed, and marketed before it is used for various end uses such as a food processing additive and flavour enhancer.

Over 100 countries produce significant amounts of salt with many others on a small scale. China is the biggest producer of salt in the world, accounting for approximately 22 percent, with United States providing about 16 percent and Germany and France about 7 to 6 percent. Other major producers are India, Australia, Mexico and Canada. South Africa produces less than 50% of its salt requirements, with the shortfall being made up by imports from Australia, Namibia and Botswana.

The main uses of salt are found in:

- Chemical production;
- Cooking and food processing;
- Agriculture;
- Other industrial uses such as oil and gas exploration, textile dyeing, aluminium refining, glazing, soap making and leather tanning.

The biggest consumer of salt is the chemical industry accounting for more than 60 percent of the total world production. The second largest consumer of salt is the food industries, which use approximately 30 percent. The balance is used for water treatment, production of cooling brines and other smaller application.

SALT PRODUCTION PROCESS

In 2013, South Africa had 27 salt pans. Salt resources in South Africa are confined to underground brines associated with inland saltpans, coastal saltpans and seawater. The majority of inland pans lie on rocks of the Karoo Sequence near Vryburg in the North West Province to Hopetown on the eastern border of the Northern Cape. Near Waterpoort, at the foot of the Soutpansberg in Limpopo province, a saltpan occurs on basalt of Lebombo Group. Salt refiners & packers was the largest producer in 2012, followed by Dwaggas salt, Vrysoutspan-Kalahari and Swartkops. These four companies together accounted for approximately 74 percent of the South Africa's salt production. The aforementioned companies are owned as follows:

- I. Salt Refiners and packers, owned by the Sutherland & Krok families
- II. Dwaggas salt works, owned by G Nel
- III. Saamweek Soutwerke Bk
- IV. Swartkops seeSout, owned by G Schombee

SA produces salt by solar evaporation of brines method (Fig 1). In general, the production methods do not differ materially from those implemented elsewhere in the world.

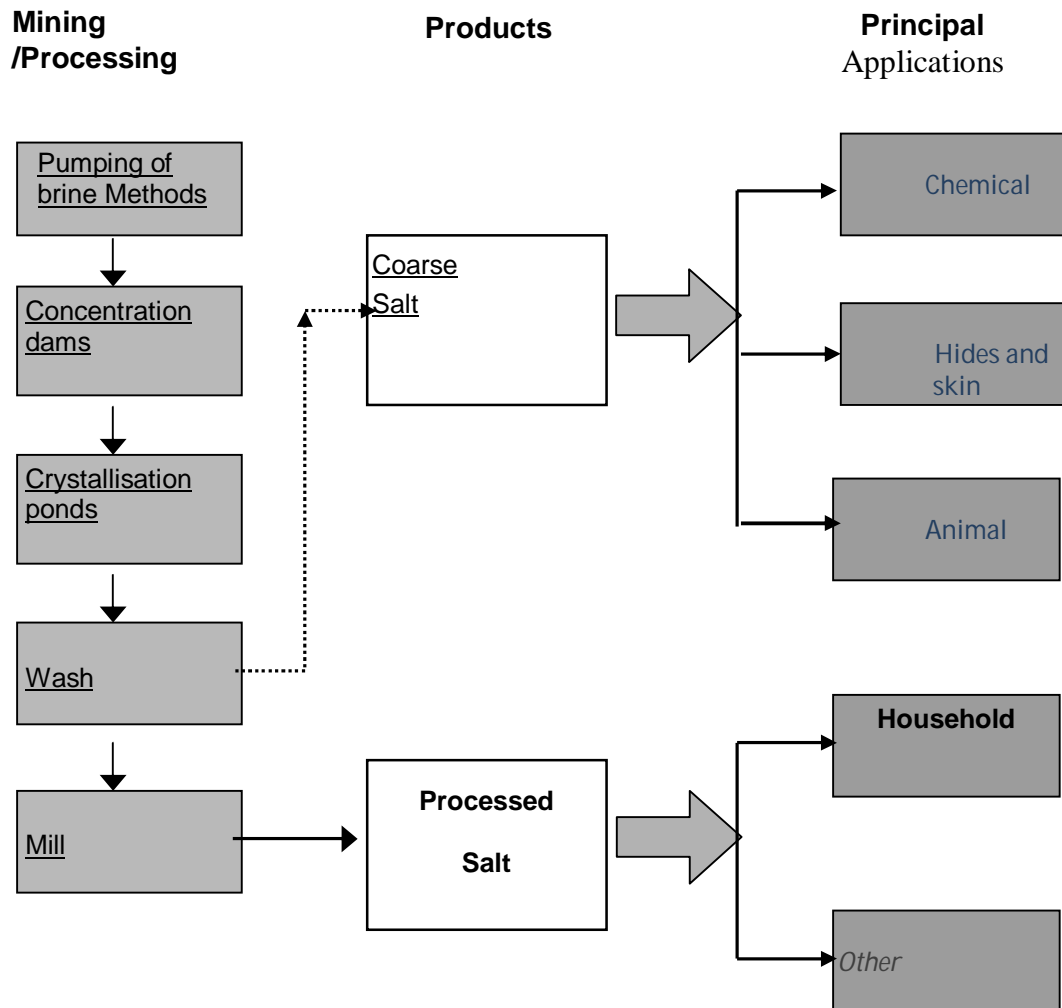

Figure 1: Basic flow diagram of salt production

Notes: Various grades of salt are available in South Africa:

- **Grade I** coarse or milled; >95% NaCl, 1.5% SO₄
- **Grade II** coarse or milled; 85-95% NaCl
- **Grade III** coarse; 75-85% NaCl
- **Grade IV** coarse; < 75% NaCl or contaminated grades I, II , III
